
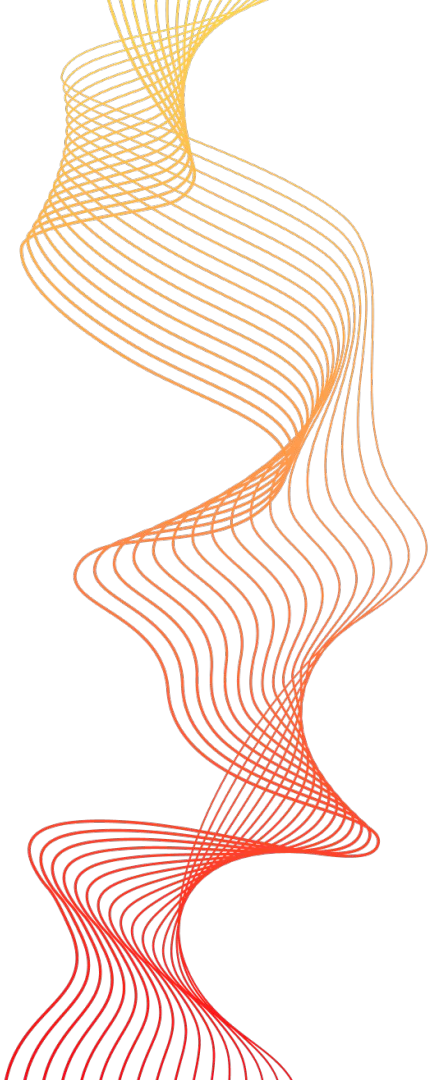
Using Firebase Auth Package

This presentation provides an overview of how to use the Firebase Auth package for authentication in your app.



Importing the Firebase Auth Package

01 This can be done by adding the necessary dependencies in our project's pubspec.yaml file.

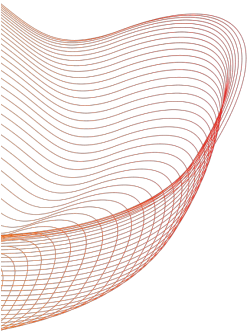
02 To use the Firebase Auth package, we need to import it into our project.

Enabling Email and Password Sign In

In the Firebase console, navigate to the Authentication section.

Enable the email and password sign-in method.

Save the changes.

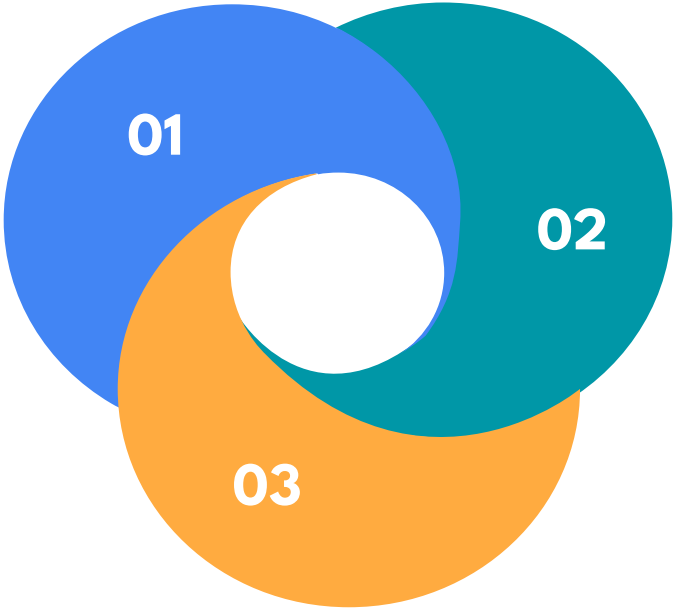


Creating a Password-Based Account

- To create a new user account with a password, use the createUserWithEmailAndPassword() method.
- This method takes the user's email and password as parameters and creates a new account.
- Handle any necessary error cases.

Signing In with Email and Password

To sign in a user with an email address and password, use the signInWithEmailAndPassword() method.



This method takes the user's email and password as parameters and signs in the user.

Handle any necessary error cases.

Thank you for your time and attention 🙂
